Mycoplasma

General:

Mycoplasma are bacteria-similar gramnegative, coccoid, cell wall located microorganisms. Mycoplasma do not have their own cell wall. Therefore, microscopic detection or staining is impossible.

Mycoplasma hominis: present worldwide, can be part of the physiological flora of the urogenital tract and is infectious under certain conditions. It is transferred sexually. In particular, younger women are affected. A non-specific pyelitis, urethritis, prostatitis, inflammation of the oviduct, amnionitis, bartholonitis as well as abortion or puerperal fever are empirically asso-ciated with mycoplasma/ureaplasma infections. In the newborn, postnatal pneumonia, meningitis and abscesses can be symptomatic. In rare cases wound infections, brain abscesses and bone infections are described. (*see also* **Ureaplasma urealyticum**). The antigen detection is possible in a bacte-riological smear test (see below).

Mycoplasma pneumoniae: The transmission occurs through droplet infection. In children under three years it causes primary infections of the upper res-piratory tract. In adolescents, also bronchitis and interstitial pneumonia. Symptoms: slow progress, fever, headaches, cough, in 5-10 % of the cases tracheobronchitis or pneumonia. The microorganism also causes the so-called Johnson syndrome of the skin particularly in younger patients; in ad-dition, it can provoke arrhythmias, heart insufficiency, meningitis, menin-goencephalitis, GBS, peripheral neuropathy as well as polyarthralgia.

The following tests are available:

Mycoplasma hominis, cultural detection and susceptibility on request^

Material: genital swab, seminal fluid, first morning urine

TAT: 2 days, FML

Method: biochemical identification in liquid medium and resistance testing

Ref.- range: negative

Mycoplasma pneumoniae DNA detection

- Indication: atypical pneumonia
 - Material: sputum, smear, tracheal secretion, bronchial lavage, swab
 - TAT: 7-10 days*
 - Method: PCR
- Ref.- range: negative

Mycoplasma pneumoniae IgM antibodies

- Indication: suspicion of acute atypical pneumonia
 - Material: 1 ml serum
 - Stability: 14 days at 2 to 8°C
 - TAT: 3 days, FML
 - Method: EIA
 - Unit: Index
- Ref.- range: see report

Mycoplasma pneumoniae IgA antibodies

- Indication: suspicion of acute atypical pneumonia
 - Material: 1 ml serum
 - Stability: 14 days at 2 to 8°C
 - TAT: 3 days,FML
 - Method: EIA
 - Unit: Index
- Ref.- range: see report

Mycoplasma pneumoniae IgG antibodies

- Indication: clarification atypical pneumonia
 - Material: 1 ml serum
 - Stability: 14 days at 2 to 8°C
 - TAT: 3 days, FML
 - Method: EIA
 - Unit: Index
- Ref.- range: see report
